Normalization and subtraction of cap-trapper-selected cDNAs to
prepare full-length cDNA libraries for rapid discovery of new genes
Genome Res. 10 (10), 1617-1630 (2000)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        EDNA library was prepared and sequenced in Mouse Genome Encyclopedia Project of Genome Exploration Research Group in Riken Genomic Sciences Center and Genome Science Laboratory in Riken.

Division of Experimental Animal Research in Riken contributed to prepare mouse tissues. First strand cDNA was primed with a primer [5' AGGAGAGAGAGAGAGCTTTTTTTTTTTTTVN 3'), cDNA was and subsequently enriched for full-length by cap-trapper. cDNA went trough two rounds of normalization to Rot = 20.0 and subtraction adapter of sequence [5' and subtraction adapter of sequence [5'].

polylinker; Site_1: Not 1; Site_2: ECO RI; The UI-R-C2p
library is a subtracted library derived from the UI-R-C0 library. The UI-R-C0 library derived from the UI-R-C0 library. The UI-R-C0 library derived from the UI-R-C0 library. The UI-R-C0 library derived from the UI-R-C0 library of manalized libraries constructed from rat placenta, adult lung, brain, liver, kidney, heart, spleen, overy, muscle, 8, 12 and 18-day embryo. The tag is a string of 3-5 nucleotides present between the Not I site and the oligo-dT track which allows identification of the library of origin of a clone within the mixture. The subtracted library of origin of a clone within the mixture. The subtracted library of origin of a clone within the mixture. The subtracted library of origin of a clone within the mixture of the subtracted library of origin of a clone with the UI-R-C1 clones from which 3 single-stranded circles. The remaining single-stranded circles (subtracted library) was purified by hydroxyapatite column chromatography, converted to double-stranded circles and electroporated into DH10B bacteria (Life Technologies) to generate the UI-R-C2P library. This procedure has been previously described (Bonaldo, Lennon and Soares, Genome Research 6: 791-806, 1996).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The sequences given in AAR75197-98 represent rodent derived Gal-beta-1,3GalNAc,alpha-2,3-sialic acid transferase. The protein has characteristic features of a receptor having a substrate specificity of a glycolipid or a glycoptein having a disaccharide Gal-beta-1,3-GalNAc at the terminal. The receptor substrate is pref. selective with sialic acid being taken up rather than glycolipid-disaccharide, in the presence of glycolipid, and successive uptake of sialic acid is in the order of GgA-GMI>GDib in glycolipid. The transferase is used in the prevention of cancer metastasis, viral infection, anti-inflammatory, nerve cell stimulation, or stimulation of physiological activity by binding with
                                                                                                                                 DNA encoding Gal-beta-1, 3GalNAc alpha-2,3-sialic acid transferase useful in prevention of cancer metastasis, viral infection, etc..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       204 rAlaLysAsn......LeuProAlaAsnValSerbheValL 216

Gal-beta-1.3GalNAc, alpha-2,3-slailc acid transferase protein has characteristic features of a receptor having a substrate specificity of a glycolipid or a glycoprotein having a disaccharide Gal-beta-1,3 GalNAc at the terminal. The receptor substrate is pref. selective with stalic acid being taken up rather than glycolipid-disaccharide, in the presence of glycolipid, and successive uptake of sialic acid is in the order of g42GMT-SGDIb in glycolipid. The transferase is used in the prevention of cancer metastasis, viral infection, anti-inflammatory, nerve cell stimulation, or stimulation of physiological activity by binding with sialic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  receptor;

The sequences given in AAQ94307-08 represent active fragments of rodent derived Gal-beta-1,3GalNAc,alpha-2,3-sialic acid transferase. The active fragments are linked to heterologous N-terminal sequences. The Gal-beta-1,3GalNAc,alpha-2,3-sialic acid transferase protein has a sysolipid or a glycoprotein having a substrate specificity of a sysolipid or a glycoprotein having a disaccharide Gal-beta-1,3-GalNAc at the terminal. The receptor substrate is pref. selective with sialic acid being taken up rather than glycolipid-disaccharide, in the presence of glycolipid, and successive uptake of sialic acid is in the order of Gg4>GMI>GDi in glycolipid. The transferase is used in the prevention of cancer metastasis, viral infection, anti-inflammatory, nerve cell similation, or stimulation of physiological activity by binding with
                                                                                                                                                                                                                                                                                                                                                                                                                                               receptor;

                                                                                                                                                                                                                                                                                            This sequence represents the human alpha2-3 stalate transferase. The invention relates to a method for the preparation of stalate transferase. In the method, E. coli is transformed with an expression vector containing a stalate transferase gene and a maltose-combined protein gene, the transformant is cultured to form stalate transferase, and stalate transferase is collected from the culture. The method can express stalate transferase as an active soluble protein and can prepare alpha2-6 stalate transferase easily and efficiently in a large amount.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               384

Human ST3N is human Ga 1 beta 1,3(4)G lcNAc alpha 2,3 sialyltransferase. Human ST3N enzyme is quite similar to rat enzyme which has been found to preferentially act on type 1 chain (Gal beta 1,3 GlcNAc), but which can also catalyse the sialylabiton of type 2 chain (Gal beta 1,4 GlcNAc), albeit with lower catalytic efficiency. Note: AAR65242 contains 20 AAS less than would be predicted from the translation of AAO82871, suggesting a possible error in the published patent specification.
                                                                                                                                                                                                                                                                                                                                                                                                                             seq_name: /SIDS1/gcgdata/hold-geneseq/geneseqp-emb1/AA1995.DAT:AAR65242

                                                                                                          AAQ73117 encodes AAR62808 alpha 2, 3-sialyl transferase (AST). AST can be used in the preparation of a sugar chain having a useful physiological activity, such as a sialyl-Lewis-A or X, and their modified products.
                                                                                                                                     Alpha 2,3'-sialyl transferase and DNA encoding it - useful for prepn. of e.g. sialyl-Lewis-A or -x sugar chains
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 102 PheSerLysProAlaProMetPheLeuAspAspSerPheArgLysTrpAl 118

```
content of N-acetyllactosamine repeated structure in the sugar chain of
a glycoprotein or a glycolipid produced by a cell. The intracellular
expression of the silatet transferase gene is increased, and the
relative activity of Siar to the activity of beta-1,3-N-acetylglucosamine
transferase (iGnT) is increased.

                    Sialyltransferase catalyses the addition of sialic acids to carbohydrate groups which are present on glycoproteins and glycolipids or to sugar chains to produce carbohydrates which function as determinants in blological recognition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  239

```
Site-directed mutagenesis eliminated the internal EcoRI site using a primer which binds to nucleotides 295-311 of the sequence encoding this protein. An A to G transition abolished the EcoRI recognition site, GGAATTC, but preserved the native amino acid coding sequence (amino acid 41). The altered sequence was used in a expression vector for the transfection of cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Expression of recombinant glycoproteins such as erythropoeitin, where the natural mixt. of sialic acid linkages differs from that of the recombinant glycoprotein produced in CHO cells, is possible.
                                                                                                                                                                                                                                                                                          /note= "peptide sequence overlap, including NH2-terminal sequence of the purified sialyltransferase"
Beta-galactoside alpha 2,6 sialyltransferase; recognition site; site-directed mutagenesis; expression vector; erythropoletin; sialic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 7..28
